ABOUT THIS GUIDE
The Aruba Instant On Deployment Guide is designed to enable customers to achieve optimal results when using Aruba Instant On products. This document serves as a deployment guide and also provides product selection recommendations, network design considerations per desired use cases, and best practices for each deployment.

INTENDED AUDIENCE AND SCOPE
This document is intended for small business owners and Aruba Partners, who are responsible for deploying and configuring Aruba Instant On devices. It is expected that readers have a basic understanding of networking concepts.

RELATED DOCUMENTS
In addition to this document, readers are advised to check the following product documentation for step-by-step configuration details.

- Aruba Instant On User Guide

ARUBA INSTANT ON OVERVIEW
Aruba Instant On is a new family of access points (APs) and switches designed to address the current and future needs of small businesses. The Instant On product family provides a reliable, high-speed and secure Wi-Fi experience built on Aruba’s decades’ long heritage in enterprise networking. Instant On APs come with DHCP, NAT, firewall and router capabilities that allow them to be directly connected to an ISP modem. This purpose-built access point portfolio also supports Smart Mesh technology to satisfy the ever-growing coverage needs of small businesses. The portfolio has 8, 24 and 48 port PoE switches to meets the needs of different use cases such as cameras, lighting as well as wired phones and speakers as well as to power the APs via PoE.

PRODUCT PORTFOLIO
This product family includes indoor and outdoor access points to support multiple deployment scenarios. Refer to the following table for details.

The portfolio can be managed with a Cloud portal and a Phone App (iOS, Android) and provides an easy way to onboard, setup and manage the Instant On portfolio of APs and Switches.

DESIGNING AN INSTANT ON NETWORK
Site design
Instant On is a simple, easy to deploy turnkey networking solution consisting of one or more Instant On APs or Switches. A single site can include up to 25 Instant On Devices (mix of APs/Switches) supporting 8 wireless (SSID) and 22 wired (VLAN) networks. The Instant On portfolio offers a number of ever-expanding list of features including Smart Mesh, DHCP, NAT support, LAG, RSTP, client blocking, firewall rules that meets the needs of Small Business.

The first device to connect to the ISP equipment can either be an AP or a Switch. Instant On APs have the option of acting as a router (and can handle PPPoE configuration) and can also act as a DHCP server providing IP addresses to the wireless network. The first device at a site can be configured either using DHCP or static IP using PPPoE.

Using DHCP: (applies to APs and Switches)
Connect the access point to power and connect the ethernet cable to the ISP modem/gateway. It will automatically obtain an IP address from DHCP and connect to the Internet and be ready to be onboarded to the site.

Using PPPoE (applies only to APs):

- If you need to connect to the ISP’s server and get authenticated, then follow these simple steps. After the AP boots, it will broadcast an SSID InstantOn-AB:CD:EF
- Connect to this SSID and use the web browser and enter the URL [https://connect.arubainstanton.com](https://connect.arubainstanton.com). Enter the authentication credentials and you are done.

Please make sure the following ports (TCP 80, TCP 443, and UDP 123) are not blocked by the ISP modem/gateway, so that the Instant On device has connectivity to the Internet.

It is required that all Instant On APs that need to be part of the same network are connected to the same Layer 2 wired network. Instant On APs can act as a DHCP server for wireless clients only (i.e., it cannot hand out IP addresses to wired clients and other Instant On APs connected to the wired network).

**RF Settings and Coverage**
Users have the ability to tweak the AP settings to control the RF environment. With this comes the ability to:

1. Control network band of operation. There are 3 options:
   a. 2.4GHz and 5Ghz
   b. 2.4 GHz only
   c. 5GHz only
2. Select channels
3. Select channel width

It is important to recall that Radio Frequency signals with higher frequency cover short distance compared to the low-frequency signals. Most wireless client devices are available to communicate over the 2.4 GHz (low freq.) and 5 GHz (high freq.) bands and by default Instant On APs are available to negotiate with those clients over both bands. It is highly recommended for the clients to connect over the 5GH band for higher throughput and performance but there can be scenarios where a larger coverage area may be desired.

Instant On provides the option for clients to still be connected over long ranges with the tradeoff of the lower speeds offered by the 2.4 GHz band. This can also be useful if the environment has a lot of obstructions (metal structure, walls, etc.) and coverage over lower speed is preferred over no coverage over higher speeds.
### Switch Port traffic authentication, control, and aggregation

Users have the ability to tweak the switch settings to control port traffic. With this comes the ability to:

1. Port access control (802.1X)
2. Only allow traffic from a defined network at the port level. (Default: all networks)
3. Link Aggregation (LAG) for Increased bandwidth/resilience. Instant On and LACP versions.

### Features:

1. **Application Visibility** – Instant On provides detailed visibility into the applications used in your network. It also shows a quick summary consisting of the top 5 apps. Users also have the ability to turn off application visibility which may improve performance. In this case, they will be able to view the traffic usage per client.
2. **Multiple Networks and Bandwidth control** – Control the amount of bandwidth each user/network can access. Users can set up multiple networks for different use cases. For example, in a Work From Home scenario, there can be one network for work related activities with no bandwidth control, another network for kids and yet another one for guests with limited bandwidth and site restrictions.
3. **Two Factor Authentication** – Ensure that your account is secure by using your mobile phone and a second token to access your account.
4. **Client Blocking** – Easily block clients if they interfere with network operations and unblock them after they start behaving again. This is useful to prevent attacks from endpoints that are compromised.
5. **Installation Wizard** – Follow the simple guided steps to setup your network according to your unique requirements in minutes. The AP placement wizard provides suggestions on where to place your meshed APs.
6. **RADIUS proxy** – For authentication with an external RADIUS, simplify your configuration by using a proxy IP address.
7. **IP Reservation** – For legacy and IoT devices that always should get the same IP address across reboots, the DHCP server on the AP allows for reservation of IP addresses.
8. **PoE Scheduling** – This feature not only saves energy but also improves the security posture for Small Businesses. Use PoE scheduling to automatically turn off (PoE powered) APs after a certain time (say 10 pm) to not only save energy but also prevent unwanted access to the network overnight.
9. **LED quiet mode** – Turn off the LEDs easily on the app to ensure the AP blends into its surroundings
10. **Editable Client Name** – Gives an ability to change client names for wired as well as wireless clients. Maximum supported length up to 32 characters, special characters are not supported though. This feature will be useful to identify personal devices such as cell phones and shared resources like printers.
11. **Shared Services** – Instant On supports Apple Bonjour, and Google Cast to discover devices and services on same L2 network without requiring any configuration. Instant on supports four types of shared services
namely, print remote management, sharing, streaming. These services are available only on Employee type network.

12. **Built-in Customizable Captive Portal** – Use the capabilities of the built-in captive portal partners to customize the logo, welcome message and the terms and conditions for the Guest users in your network.

13. **External Captive Portal** – For capabilities such as analytics and to improve marketing capabilities for Guest networks, Instant On offers support for following providers:
   1. Aislelabs
   2. Purple
   3. Skyfi
   4. Wavespot
   5. Zoox

The customer benefits are summarized below
   - Free features on Captive portal with Instant On
   - Easy integration with captive portal
   - High ROI, customer loyalty, advanced analytics and marketing capabilities to improve business
   - For Partner managed service, Partner can buy a pool of licenses and have the ability to manage all their customers

14. **Firewall Rules** - New network access control page will allow the site administrator to configure network access. User can set network to be either Restricted or Unrestricted to their subnet. User can also set restricted access with a list of accessible IPs from other subnets. Only supported for wireless clients/networks.

15. **Nord VPN Partnership** – Aruba Instant On supports multiple VPN vendors such as OpenVPN, KeepSolid VPN, ProtonVPN and has a partnership with NordVPN with discounted pricing. For Instant On customers discounted pricing is available when ordering via the Instant On app. The joint solution offers many unique added-value capabilities as mentioned below
   - Works with any sized Aruba Instant On deployment, anywhere in the world, from a single access point in a home to a medium sized business.
   - Discounted pricing when ordered via the Instant On app.
   - 256-bit AES encryption, no tracking of visited sites, and high throughput for streaming
   - Optional ad blocking

**Site management**
Instant On APs and Switches support two options for hassle-free remote network management at the tip of your fingers. You may manage your Aruba Instant On deployments either using a Mobile App that is supported on iOS and Android or via a cloud portal that is accessible via a web browser. Administrative rights can be delegated to another user so that two users can manage and administer the same Instant On site.

For convenience, AP and Switch software updates are automatically performed to ensure you always have the latest and greatest software with the ever-expanding set of features and functionality. An administrator can schedule the default time that updates are performed to ensure consistency of updates.

The Instant On Mobile App offers multi-lingual support for a variety of regional languages, such as Simplified Chinese, Japanese, French, German, Italian, Spanish and Portuguese to ensure global usability. When the mobile app is opened, it detects the locale of the phone and sets the language accordingly. This configuration is saved and used every time the app launches. If the phone’s locale changes the next time the app starts, it will set this new language as the default and save it. Mobile app trouble-shooting push notifications use the same local language.

Please make sure the onboarding device (laptop or mobile phone with Instant On app) is in-sync with the local time zone as Instant On APs will be configured per the time zone of the onboarding device. It is important to note that the web portal, as well as the mobile app, support feature parity between both options.
Wi-Fi security recommendations
Aruba Instant On supports employee as well as guest networks that include multiple security options. For instance, the latest wireless authentication security standard called WPA3 (aka Wi-Fi Protected Access 3) and the latest version of WPA2 are supported. For the employee network, more robust security options are available via an External Radius server. For the guest network, there is also an ability to have open guest network which requires no steps/authentication procedures to be followed to connect to the network. This simplifies user experience but is not recommended.

Guest users should be isolated from employee and business devices for security protection by creating a dedicated network for guest usage. A customizable internal captive portal for guest access is provided to make sure that the guest users agree to use Wi-Fi per your specified terms and conditions. You can also choose to turn on advanced features like Time-of-Day based network scheduling to restrict Wi-Fi availability outside of business hours. You also have the ability to hide the guest SSID although that is not part of the best practice recommendation.

Instant On APs can assign a dedicated VLAN each to one or more employee networks so that each employee network and its resources can be isolated from other employee networks. Instant On APs also offer a client blocking option to protect the network from malicious users.

LAN security recommendations
Aruba Instant On switches support employee and guest networks (as stated above) including include multiple security options support of time of day features as well. Network management supports IGMP v1, v2, Loop protection, Flow Control and 802.3x Storm Control. Ingress Rate limiting also supported via 802.1Q and 802.1p / DSCP support 4 queues for effective traffic mapping.

Loop control supported and option to enable RSTP (rapid spanning tree protocol) for efficient convergence times once a loop is detected. RADIUS supported for wired clients on a per port basis. with 4 readily available services and option to utilize own private server if required.

By default, the switch is in DHCP mode and provisioned using untagged VLAN 1. It is possible to configure the Static IP, Netmask, Gateway IP and DNS. A different management VLAN can be specified if required. In case the uplink port of the switch requires tagging, the tagged VLAN will be set on one port of the switch (Ethernet or SFP). All other ports will remain untagged.

AP placement recommendations
Where you place APs plays a crucial role in RF coverage. Here are placement recommendations for Instant On APs.

1. AP coverage: APs can cover up to 2500 square feet under ideal conditions, but the real coverage is dependent on the location of placement and the type of construction materials used in the location surrounding it.
2. Cable types: Always use Cat5(e) or Cat6 Ethernet cables to connect APs to the switch and Internet gateway.
3. Mounting APs: Mount the APs below the ceiling with the wires running above. APs that are mounted below the ceiling perform better because their signals are not affected by any surrounding ducting, power cables, and other construction elements. For the AP11D, mount the AP directly to the wall using a single-gang wall-box, or use the supplied desk mount.
4. AP location: identify the areas where Wi-Fi coverage is required, then place the APs accordingly. For example, place the APs inside of offices or hotel rooms rather than in hallways. This provides more efficient coverage with minimal interference. Also, avoid placing APs in the closet or behind solid metal objects. For more guidance, refer to the installation guide available in the Instant On online community.
5. **Automatic channel selection**: Instant On APs are dual-band access points (i.e., supports 2.4 GHz as well as 5 GHz frequencies). Selection of the optimal channels and transmission power is critical for optimal Wi-Fi performance and experience. Instant On APs support automatic selection of the best channels, transmission power and channel width to ensure that each AP offers the optimum experience to the users at any given point in time. When choosing an operating channel, the Instant On AP factors in how busy the surrounding wireless medium is, as well as if there is any Wi-Fi interference generated by other W-Fi and non-Wi-Fi sources like microwaves, in order to select the least crowded channel. Given that the interference and noise levels in wireless medium can change frequently, APs regularly scan the air to optimize the channel selection and power. If the operating channel becomes too busy due to surrounding Wi-Fi or non-Wi-Fi interference, then Instant On APs will change the channel automatically without any user intervention.

6. **Outdoor APs**: When using an outdoor AP, you should place it where coverage is desired. If the outdoor AP is connected using mesh from a wired Instant On AP, the outdoor AP should be placed in the line of sight of the wired AP, if possible. The maximum distance between the wired Instant On AP and mesh outdoor AP should not be more than 100 meters. For the better client connectivity AP17 has a range of 50 meters considering there are no apparent obstacles such as thick concrete walls. Outdoor APs should be installed within 3 meters minimum, 15 meters maximum height from the ground.

**Smart Mesh design**

The Aruba APs support Mesh Wi-Fi to provide the ability to extend the network to hard-to-wire areas. Instant On APs offer simple to configure Smart Mesh that you can set up in minutes. After the first Instant On AP (wired AP) has been added to the site, you can configure additional APs to connect over the air, if desired.

Although a single Instant On AP may support up to 8 Mesh APs, we recommend no more than 2 or 3 mesh APs connected to a single AP for enhanced performance. Instant On APs automatically determine the best node to connect based on signal quality and performance. For optimal performance, we recommend 1-hop mesh deployments.

For Mesh AP placement, we recommend a minimum of 16 feet (5 meters) and a maximum of 60 feet (18.25 meters) from the parent AP (the one that is wired to the switch or modem). Distance between the APs also depends on obstacles, such as thick walls, metal structures or glass. Mesh APs use the 5GHz band for backhaul connection while serving the clients on both radio bands (2.4 GHz, 5 GHz).

Another way to extend Wi-Fi coverage is by adding more Instant On APs to the same L2 switch using a network cable. As mentioned earlier, a single Instant On site may contain up to 25 access points (including those in a mesh). When available, wiring up the AP is recommended for better performance.

**Partner-managed Instant On services**

Instant On also offers remote multi-site management via the mobile app and cloud to support partner-managed IT services. IT partners can securely manage multiple customer sites (i.e., different customer networks) using a single instance of the Instant On Mobile App, without jeopardizing customer info, for convenient network administration. The Instant On app also supports real-time alerts regarding network health via email in order to initiate user intervention, if needed. This helps to eliminate dependence on on-site staffing for the end customer.

**USE CASES**

Let’s look at a few representative use cases for deployment of Instant On APs. We will discuss how to design and deploy Wi-Fi for each of these use-cases. We will also review the features that may be relevant to enable for each of the scenarios.

Although Instant On devices may be deployed for a number of different Small Business use cases, there’s a good chance that your needs align with one or more of the use cases discussed below.
USE CASE #1: Small Clinic

- **Customer Requirements**
  - Simple to deploy and easy to manage Wi-Fi solution for a small clinic with a reception and 2 rooms
  - Separation of traffic for employees and guests
  - Connectivity for wired devices including printer and desk phone
  - Client Density: 10-20 active client devices at a time

- **Hardware Guidelines**
  - Total of 3 APs – 2 units of AP11 (2x2:2) for the 2 rooms and 1 unit of AP11D (2x2:2, Desk Mount) for the reception

- **Topology**

- **Configuration Guidelines**
  - **Step 1: AP Onboarding and Site Creation**
    - We recommend the desk mounted AP11D to help in connecting desk phones and wired printers in the reception
    - When creating a new wireless network, by default the network will be assigned to the wired management network or a new wired management network will be created if one has not been created.
    - If the AP is connected directly to the ISP modem, ISP should provide the management IP address Instant On AP. If ISP only offers a single IP address, then an external gateway or router is required to hand out IP address for the AP.
    - Choose Router mode for the Instant On AP. It also has a built in NAT and firewall for security.
    - The first Instant On AP will act as a DHCP, NAT server for wireless clients (picture below)
• Step 2: Extend the network using one-touch Mesh
  • Add an AP1 by wiring it to the AP11D in the reception
  • Extend the coverage to the second room by creating a mesh link between the two AP1 in the clinic rooms

• Recommended Feature Set

USE CASE #2: Medium/Large Coffee Shop

• Customer Requirements
  • Hassle-free, reliable Wi-Fi experience for customers indoors (large open hall) and outdoors (patio)
  • Simple to deploy and easy to manage Wi-Fi solution
  • Secured Wi-Fi access for employees and guests with the ability to scale during peak times
  • Client Density: 40-50 active client devices at a time (indoors and outdoors) with client count doubling during peak hours
- **Hardware Guidelines**
  - Total of 3 APs – 2 units of AP15 (4x4:4) for the wide-open large hall and 1 unit of AP17 (2x2:2) for outdoor use
  - One Instant On Switch – 1930 8G 4SFP/SFP+ Class 4 PoE to support APs and other wired devices such as printers, cameras and cash registers

- **Topology**

- **Configuration Guidelines**
  - **Step 1: Instant On Switch Onboarding and Site Creation**
    - If the coffee shop has the need for wired PoE connections such as cameras, cash registers or printers, they can be connected to the Instant On 1930 8-port PoE switch
    - Connect the Instant On Switch to the ISP modem
    - ISP should provide the management IP address to Instant On Switch. If ISP only offers a single IP address, then an external gateway or router is required to hand out IP address for the switch.
    - At the time of site creation on the cloud portal, a default wired network is created

  - **Step 2: Instant On AP Onboarding**
    - We recommend AP15 (a 4x4 AP) to provide the wide coverage needed in an open space such as a coffee shop
    - When creating a new wireless network on the cloud portal to onboard the AP, by default the network will be assigned to the wired management network or a new wired management network will be created if one has not been created.
    - Add another AP15 to the switch and place optimally (see section on AP placement) to ensure coverage for the coffee shop

  - **Step 3: Extend the network**
• Add an outdoor AP (AP17) to extend the coverage to outdoor spaces such as a patio using a wired connection to the switch

• Recommended Feature Set

<table>

</tbody>
</table>

**USE CASE #3: Motel or Bed and Breakfast**

• **Customer Requirements**
  - Easy to manage Wi-Fi solution for the reception, breakfast area (high density), ten rooms and pool (outdoor)
  - Each room needs to have a wired desk phone, an IPTV and an optional wired port for further expansion
  - Secured Wi-Fi access with separate networks for employees and guests
  - The network should be able to scale with business growth
  - Connectivity for phones, cameras, printers and IoT devices such as door locks and PoE lighting for pool areas
  - Isolation of clients connected to the guest network to prevent direct inter-client communication
  - **Client Density:** 75 – 100 active client devices at a time (indoors and outdoors)

• **Hardware Guidelines**
  - Total of 14 APs – 10 units of AP11D (2x2:2 with Desk mount) – one for each room, 1 unit of AP15 (4x4:4) for the breakfast area, 1 unit of AP22 (2x2:2 Wi-Fi 6) for the reception and 2 units of AP17 (2x2:2) for outdoor use
  - Total 1 Instant On Switch – 1930 48G 4SFP/SFP+ Class4 PoE 370W to support APs and other wired devices such as printers, door locks and IoT lighting devices

  o **Topology**
**Configuration Guidelines**

- **Step 1: Instant On Switch Onboarding and Site Creation**
  - We recommend a 1930 48-port PoE switch for this deployment to handle the number of PoE and wired connections for phones, cameras, APs and IoT lighting. The additional ports can be used for connecting VoIP server, streaming devices and set top boxes.
  - Connect the Instant On Switch to the ISP modem
  - ISP should provide the management IP address to Instant On Switch. If ISP only offers a single IP address, then an external gateway or router is required to hand out IP address for the Switch.
  - At the time of site creation on the cloud portal, a default wired network is created

- **Step 2: Instant On AP Onboarding**
  - We recommend AP11D (2x2 Desk mount AP) to provide the additional wired connections needed in the reception area including wired printers and desk phone
  - When creating a new wireless network on the cloud portal to onboard the AP, by default the network will be assigned to the wired management network
  - The first wireless network will always be an employee network. Create three networks with different network quality and control to separate high-priority employees (IT team) from other employees and guests. For this deployment, select Authentication server (RADIUS) for first employee network, add server IP, and shared secret for the same. Select WPA3 personal for the second employee network and the guest network.
  - The first Instant On AP will act as a DHCP, NAT server for wireless clients.
• IP and VLAN assignment: Select Instant On (NAT) option for guest network so that clients will receive an IP address provided by the Instant On AP.

![IP and VLAN assignment](image)

- Step 3: Guest Network Creation
  - Since the first network has been created, now we can create the second employee network and the guest network.
  - Client isolation is enabled by default for guest network. That means clients connected to the guest network are isolated from reaching other clients directly over the WLAN. Note that any network resources for e.g., printers connected to guest network are not reachable directly by the guests.

- Step 4: Extend the network
  - To the AP11D via a wired connection, we recommend adding a AP22 (2x2 Wi-Fi 6) in the lobby area where there can be high wireless client density (to handle incoming visitors)
  - All AP11D AP in the rooms need to be connected directly to the 1930 switch via a wired connection. The desk phone and the IPTV in the rooms can use the wired ports on the AP11D present in each room
• Add couple of outdoor APs (AP17) to extend the Wi-Fi coverage to the pool area by connecting them to the switch
• Regardless of where a user goes, all wireless networks will be available and provide seamless transition across locations in the hotel

• Recommended Feature Set

**USE CASE #4: Work from Home**

• **Customer Requirements**
  • Reliable and secure Wi-Fi solution, for running a business from home
  • Separate network for business, home and children’s’ use with different QoS and bandwidth settings
  • Ability to support streaming, audio video content
  • Parental control, ability to block web content as well as restricting duration of network access
  • Minimal configuration, hardware and setup needed
  • Extend the network to an outdoor area (yard)
  • Mesh networking needed in hard-to-wire location with option to have a wired printer from the meshed AP
• Connectivity for cameras, TV and gaming devices
• Client Density: 10 – 30 active client devices at a time (indoors and outdoors)

• Hardware Guidelines
  • Total of 5 APs – 3 units of AP12 (3x3:3) for the bedrooms as well as the open area (Hall), 1 unit of AP11D (2x2:2 with Desk mount) for the hard-to-wire location and 1 unit of AP17 (2x2:2) for outdoor use
  • Total 1 Instant On Switch – 1930 24G 4SFP/SFP+ Class 4 PoE 370W to support APs and other wired devices such as cameras, TVs and gaming devices

  o Topology

  o Configuration Guidelines
    • Step 1: Instant On Switch Onboarding and Site Creation
      • We recommend a 1930 24-port PoE switch for this deployment to handle a number of wired connections to cameras, APs, TV and gaming devices across the home
      • Connect the Instant On Switch to the ISP modem
      • ISP should provide the management IP address to Instant On Switch. If ISP only offers a single IP address, then an external gateway or router is required to hand out IP address for the Switch.
      • At the time of site creation on the cloud portal, a default wired network is created

    • Step 2: Instant On AP Onboarding
      • We recommend AP12 (3x3:3) for running your business from home while also hosting the home and children’s’ SSID on the same wireless network
      • When creating a new wireless network, by default the network will be assigned to the wired management network or a new wired management network will be created if one has not been created.
• The first Instant On AP will act as a DHCP, NAT server for wireless clients

![IP and VLAN assignment](image)

- **Step 3: Home and Kids Network Creation**
  - Since the first network has been created, now we can create the second network for Home users and Kids network for children
  - Client isolation is enabled by default for the two new networks. That means clients connected to the home network are isolated from reaching other clients directly over the WLAN. Note that any network resources for e.g., printers connected to home network are not reachable directly.
  - Set per-network bandwidth limits for the Home network to prevent unlimited usage from consuming a large portion of the bandwidth
  - Do the same for the Kids network and also use the Time of Day SSID feature to make the network available only at specific times of the day.
  - On the Kids network, additional restrictions to visiting sites can be achieved by using the Application Blocking feature and turning off access to unwanted categories of traffic

• **Step 4: Extend the network**
  - Add the two other AP12 access points and the three networks will also be made available to those APs
  - Set up Mesh networking for the hard-to-wire room with AP11D and use the downlink port to connect legacy wired devices such as printers. AP11D allows wired devices in remote corners of the house get a wired connection through a Mesh link to the nearest AP
  - For outdoor use (yard), add an outdoor AP (AP17) and have it wired to the switch
  - Now the same set of access points will be serving 3 different SSIDs regardless of where the user may be located

- **Recommended Feature Set**

### SUMMARY

Aruba Instant On access points and switches are designed with small businesses in mind. It is a simple, secure, and reliable solution that small businesses deserve. Instant On APs come with two-year hardware warranty and Instant On Switches limited lifetime warranty respectively. Instant On APs and Switches offer 24x7 phone support for 90 days, 24x7 chat support (two years for APs and limited lifetime for Switches) and an active online community to take care of any product questions or concerns. Click here to learn more about Aruba Instant On devices.

To keep you worry-free, Aruba offers optional Foundation Care support services for Aruba Instant On. Adding Foundation Care support is simple and extends the warranty and support to a period of 3 years. Add Foundation Care with new Instant On purchases within 90 days of original purchase to obtain these benefits.

<tbody>
<tr>
<td>Network and WPA3 Personal for Home and Kids</td>
<td>Aruba Instant On APs come with a built-in firewall that can block any unwanted or unsolicited traffic coming in from the Internet to keep malicious hackers at bay. Aruba Instant On APs have a built-in deep packet inspection (DPI) engine and firewall to offer you visibility into the different application and website categories that users on each of the networks are accessing. You also have the ability to block one or more traffic types. This can be used by parents to block age-restricted content for the home network.</td>
</tr>
<tr>
<td>Block unsolicited traffic</td>
<td></td>
</tr>
<tr>
<td>Block undesired traffic categories</td>
<td></td>
</tr>
<tr>
<td>Editable Client Name</td>
<td>Easily identify devices important to you such as IoT devices (pool light, lobby camera, etc.)</td>
</tr>
<tr>
<td>LED Quiet Mode</td>
<td>For in-room APs where the LEDs can be turned off to blend in with the rest of the room</td>
</tr>
<tr>
<td>QoS</td>
<td>Instant On has enabled this feature in the background to automatically prioritize for voice/video traffic (enabled by default)</td>
</tr>
<tr>
<td>Dynamic RF Optimization</td>
<td>Instant On has enabled this feature in the background to dynamically change the operating channel and adjust Tx power in case of co-channel interference (enabled by default)</td>
</tr>
<tr>
<td>Time of the Day SSID</td>
<td>Control Wi-Fi usage outside of configured time. Very handy feature to reduce screen time for children</td>
</tr>
<tr>
<td>Smart Mesh</td>
<td>Aruba Instant On APs offer One click mesh easy way extend the Wi-Fi coverage at hard to wire areas and ensure better coverage. For e.g., patios and multiple floors and larger rooms.</td>
</tr>
<tr>
<td>Nord VPN Partnership</td>
<td>256-bit AES encryption, no tracking of visited sites, and high throughput for streaming. Discounted pricing when ordered via the Instant On app</td>
</tr>

**Note:** For in-room APs where the LEDs can be turned off to blend in with the rest of the room.
• Three years of Next Business Day advanced replacement of defective network equipment and parts — so your network can stay up and functioning as expected.
• 24x7 telephone support access to our Aruba experts — delivered by the Aruba Technical Assistance Center (TAC).
• Three years of software support along with advice from our Aruba experts on any questions or concerns.
• Three years of chat support provided through our Aruba Instant On community.

Speak to your Aruba authorized business partner today about adding Foundation Care support services for Aruba Instant On Access Points and Switches.
